

For the scenario below identify the **entities**, their **attributes** and appropriate **keys**

Finsbury Happy Zoo

Finsbury Happy Zoo's concept is to show animals together in their habitats. They have a **number of enclosures** of **different habitat types** (such as forest or tundra), **different sizes** (square metres), each having a **main feature** (such as a stream or a cave). **Animals** of different species share the same enclosure. Each **enclosure has a unique number** and there can be several enclosures with the same habitat but with a different main feature or of a different size. Each **animal has a unique ID**, and their **name**, **date_of_birth**, **diet** and **description** are stored. When an animal is put in an enclosure, the **start date is recorded**, and if they are transferred to another enclosure the **end date is recorded**. Zoo keepers may need to make a **note about a particular animal**, for example "not eating well today" and this is **recorded along with the date**. To make sure the animals don't eat each other a species compatibility table is maintained which has the following information; speciesA, speciesB, **compatibility_rating** (5 for happy neighbours to 1 for bitter enemies). **Species** are identified by their **name**, and a **description** of the species and their **habitat type** are recorded. Species are matched against enclosures by Zoo staff, and if suitable the **maximum number of animals** of a particular species for a particular enclosure is recorded to prevent overcrowding.
